

DevArt Article Photo Manual

Dashboard

The Dashboard is the main starting page of DevArt Article Photo and provides quick access to the component's most important functions.

The administrator interface is intentionally designed to remain lightweight, responsive and easy to use, even on large Joomla news websites with multiple editors.

At the top of the Dashboard, a responsive branding header is displayed. The header automatically adapts to smaller screens and remains centered on desktop and mobile administrator layouts.

Below the header, the Dashboard contains quick-access panels for the main component sections:

New Photo

The “New Photo” section opens the image generation workspace where editors can upload an image, crop it, apply zoom adjustments, add logos or watermarks, generate previews and save the final article-ready image.

This is the primary daily workflow used by editors preparing article images for Joomla articles and news posts.

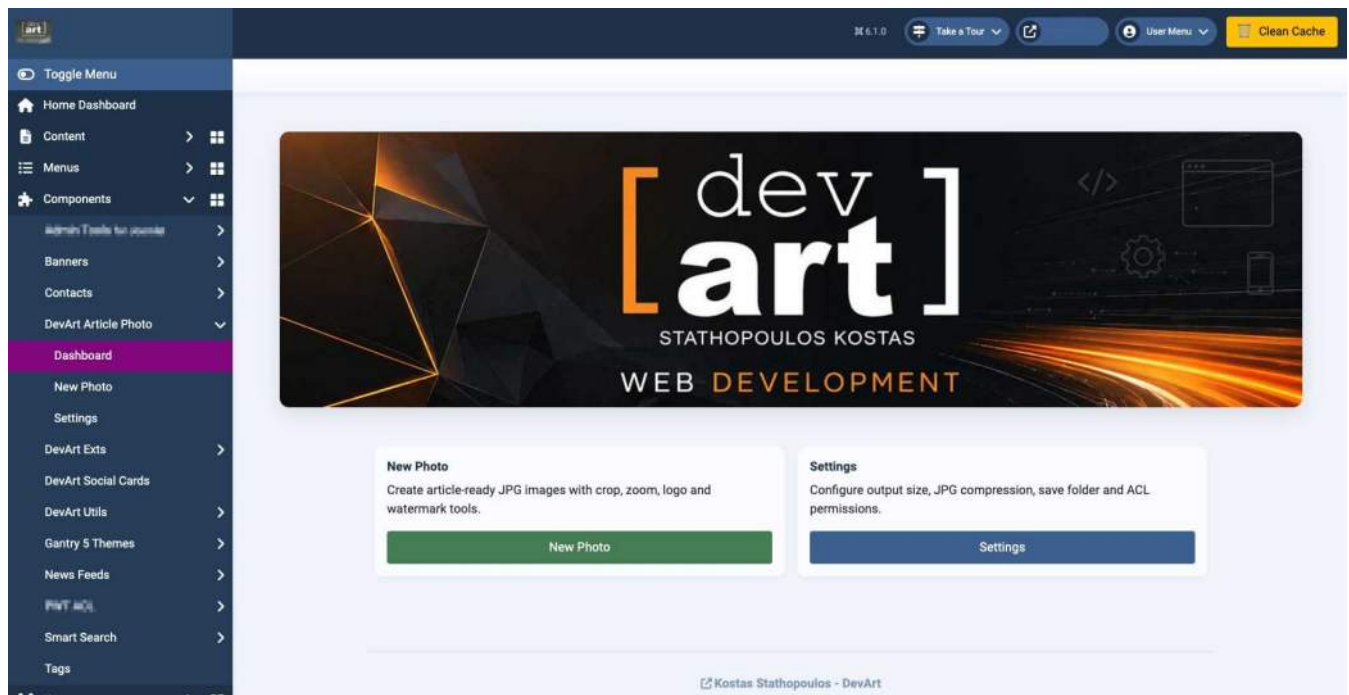

Settings

The “Settings” section provides access to the component configuration overview and Joomla Options integration.

Administrators can review:

- Current JPG compression level
- Default save folder
- Default filename prefix
- Maximum allowed source image size
- Current output workflow recommendations

The Dashboard is designed to minimize clicks and simplify the editorial workflow for high-volume publishing environments.

New Photo

The “New Photo” page is the core workspace of DevArt Article Photo.

This interface allows editors to generate optimized article-ready JPG images directly inside Joomla without using external desktop software.

The layout is divided into two main areas:

- Image controls and editing settings
- Live preview and output actions

The page is fully responsive and optimized for Joomla 6 administrator layouts.

Image Upload

Editors can upload:

- JPG
- JPEG
- PNG
- WEBP

images directly from their computer.

After an image is selected, it becomes available for preview generation and editing.

The component is optimized for editorial workflows and supports large source images while still generating lightweight final JPG files.

Filename Prefix

The Filename Prefix field allows editors to define the beginning of the generated filename.

Example:

- article
- sports
- kalamata
- politics

The component automatically validates the input and allows only latin characters without spaces.

This improves:

- SEO consistency
- filesystem compatibility
- URL cleanliness

The generated image filename will include this prefix automatically.

Zoom Control

The Zoom slider allows editors to enlarge or reduce the visible crop area before generating the final image.

This is useful when:

- focusing on faces
- improving thumbnail framing
- adjusting landscape images for article formats
- removing unnecessary empty space

The current zoom level is displayed live next to the slider.

Crop Position

Crop Position determines which area of the source image remains visible after resizing.

Available crop positions include:

- Center
- Top Left
- Top Center
- Top Right
- Bottom Left
- Bottom Center
- Bottom Right

This feature is especially useful for news websites where the subject of the image must remain visible in fixed article dimensions.

Logo Overlay

The “Enable Logo” option allows editors to place a branding logo over the generated image.

Once enabled, additional controls appear automatically.

Available settings include:

Logo File

Upload a transparent PNG logo.

The last uploaded logo is reused automatically while adjusting settings.

Logo Position

Select where the logo will appear on the image.

Typical positions:

- Bottom Right
- Bottom Left
- Top Right
- Top Left

Logo Size

Adjust the logo width as a percentage of the final image width.

Logo Safe Margin

Controls the spacing between the logo and the image edges.

Logo Opacity

Adjust the transparency level of the logo overlay.

This allows subtle branding without overwhelming the image.

Watermark Overlay

The “Enable Watermark” option adds a centered watermark over the image.

This is useful for:

- copyright protection
- editorial branding
- social media redistribution

- preventing unauthorized reuse

When enabled, additional controls become available.

Watermark File

Upload a transparent PNG watermark.

Watermark Size

Controls watermark width relative to the final image size.

Watermark Opacity

Adjusts watermark transparency.

Lower opacity values are recommended for editorial usage.

Live Preview

The Preview area displays the generated image before saving.

This allows editors to verify:

- crop position
- zoom level
- logo placement
- watermark appearance
- final composition

The preview updates dynamically during editing.

Auto Preview

When Auto Preview is enabled, the preview regenerates automatically while editing settings.

This creates a faster and smoother workflow for editors.

When disabled, previews are generated only after pressing the “Generate Preview” button.

Output Size

Output Size allows per-image resolution selection.

Available sizes:

- 1200 × 800 px
- 1620 × 1080 px

The default recommended size is:

1200 × 800 px

This size is intentionally optimized for:

- smaller file sizes
- faster page loading
- improved mobile performance
- lower bandwidth usage

The larger size should only be used when higher resolution is specifically required.

Unlike global Joomla settings, DevArt Article Photo allows changing the output size individually for each image without modifying component options.

Generate Preview

The “Generate Preview” button creates a fresh preview manually.

This is useful when:

- Auto Preview is disabled
- large images require manual regeneration
- editors want explicit preview control

The component uses AJAX-based preview generation to avoid full page refreshes.

Save to Disk

The “Save to Disk” button downloads the generated JPG image directly to the editor’s computer.

This is useful for:

- external editing
 - manual uploads
 - social media publishing
 - archiving
-

Save to Server

The “Save to Server” button stores the generated image directly inside Joomla.

Images are automatically organized under:

/images/YYYY/MM/

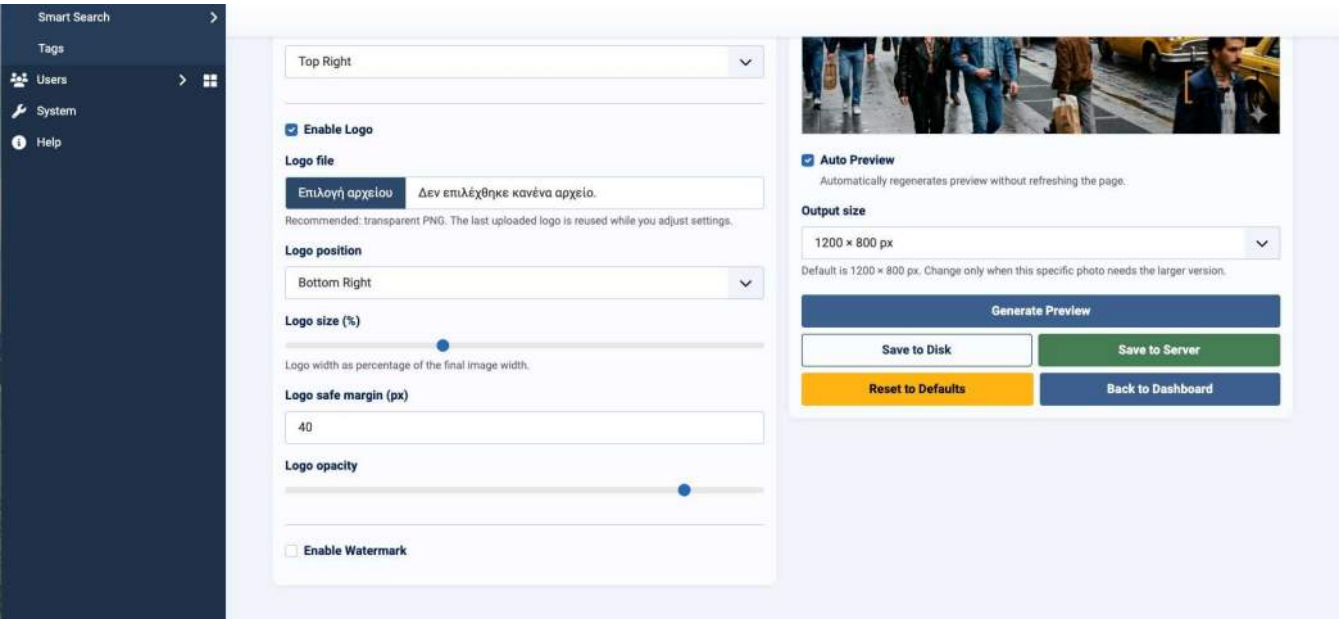

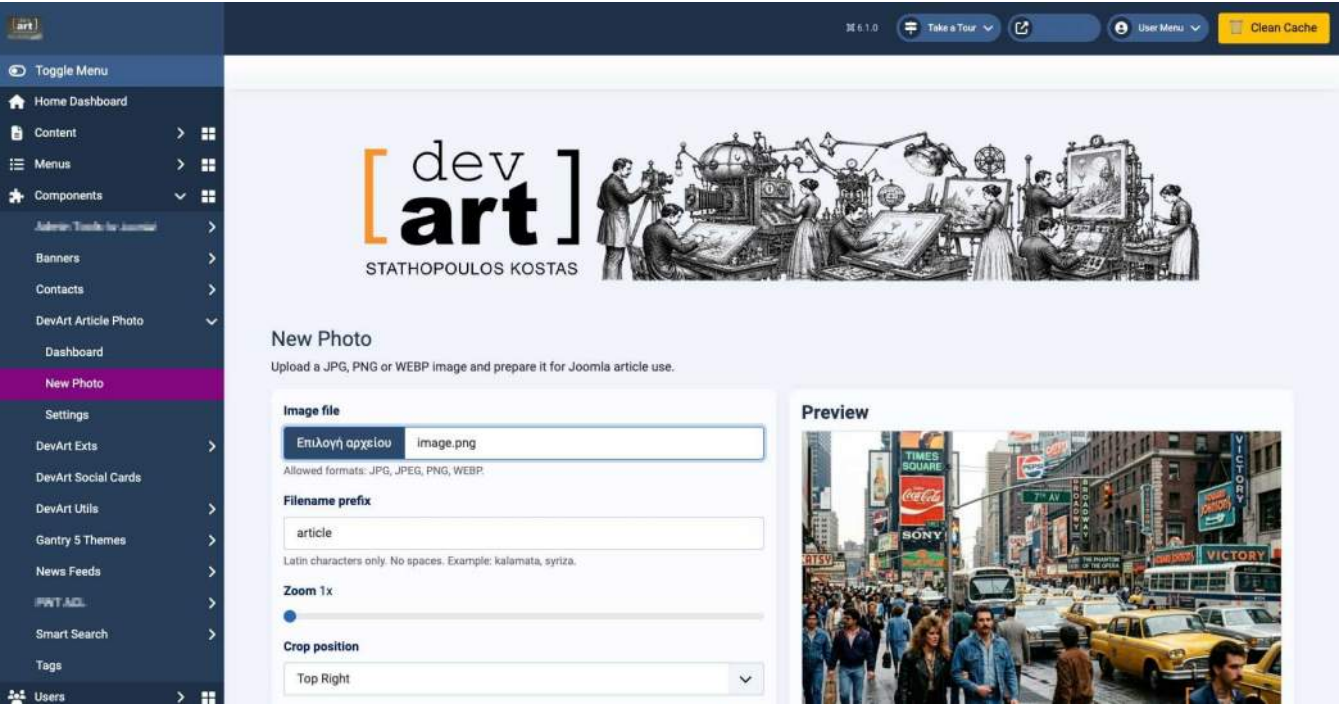

Example:

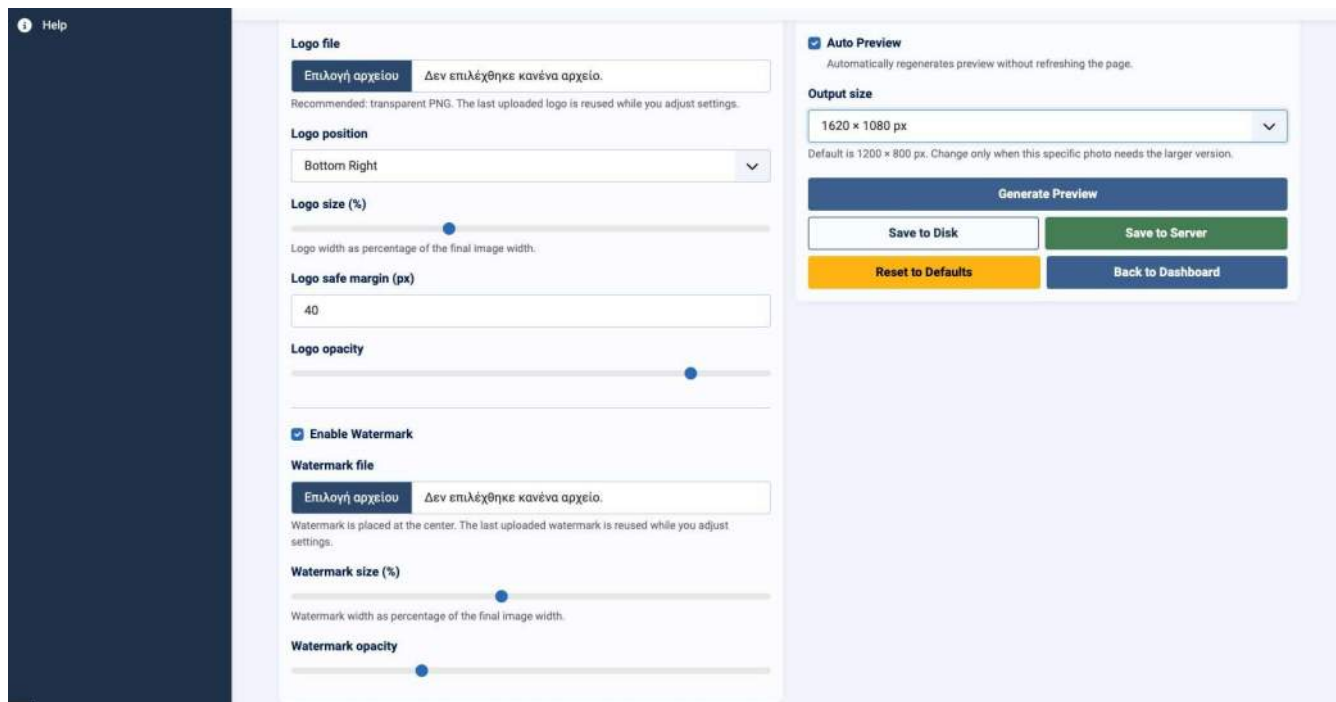

/images/2026/05/

If the year/month folder does not exist, the component automatically creates it.

No manual folder creation is required.

This structure helps keep large media libraries organized and scalable for high-volume editorial websites.

Settings

The Settings page provides a simplified overview of the current component configuration.

The page is designed to give editors and administrators a quick understanding of the active defaults without opening Joomla Options immediately.

The interface displays:

- Current output workflow
- JPG compression settings
- Default save location
- Filename defaults
- Maximum source image size

The page also contains quick action buttons for:

- New Photo
- Dashboard
- Open Options

Current Defaults

The Current Defaults table summarizes the active component configuration.

Output Size

Displays the default recommended output workflow.

DevArt Article Photo intentionally uses per-image output selection rather than forcing a single global image size.

JPG Quality

Displays the active JPG compression value.

Recommended default:

74

This value is intentionally optimized for smaller article-image file sizes while maintaining good visual quality.

Base Save Folder

Displays the root image folder used for generated files.

Example:

images/YYYY/MM

The component automatically creates the required year/month folders when saving images.

Default Prefix

Displays the default filename prefix shown in the New Photo interface.

Maximum Source Size

Displays the maximum allowed source image megapixel size.

This protects the server from excessive memory usage caused by extremely large uploads.

Joomla Options Integration

The component uses Joomla's native Options system for configuration and permissions.

Administrators can configure:

- JPG compression
- save folder
- default filename prefix
- maximum source megapixels
- ACL permissions

through Joomla's standard administrator interface.

This ensures:

- Joomla compatibility

- predictable permissions handling
- stable upgrade behavior
- easy administration across multiple sites

Permissions (ACL)

DevArt Article Photo fully supports Joomla ACL permissions.

Permissions can be controlled through:

Options → Permissions

Available actions include:

- Access Administration Interface
- Create
- Edit
- Delete
- Configure ACL & Options

This allows administrators to safely control which editorial groups can access and use the component.

For production news websites, it is recommended to allow access only to trusted editor and administrator groups.

The screenshot displays the Joomla! administrator interface. On the left is a dark sidebar menu with options like 'Toggle Menu', 'Home Dashboard', 'Content', 'Menus', 'Components', and 'Settings' (which is highlighted). The main content area has a header with the Joomla! logo, version '3.6.1.0', and links for 'Take a Tour', 'User Menu', and 'Clean Cache'. Below the header is a banner for 'dev art' by STATHOPOULOS KOSTAS, featuring a historical illustration of a printing press. The 'Settings' section is active, showing a table of 'Current defaults' for the component. The table lists: Output size (Selected per photo (default 1200 x 800 px)), JPG quality (74), Base save folder (images/YYYY/MM), Default prefix (article), and Max source size (24 MP). Below the table, a note states: 'ACL permissions are handled by Joomla permissions for this component. Use Options → Permissions to control who can access and generate/save article photos.' At the bottom of the settings area are three buttons: 'New Photo' (green), 'Dashboard' (blue), and 'Open Options' (blue).

Current defaults	
Output size	Selected per photo (default 1200 x 800 px)
JPG quality	74
Base save folder	images/YYYY/MM
Default prefix	article
Max source size	24 MP

ACL permissions are handled by Joomla permissions for this component. Use Options → Permissions to control who can access and generate/save article photos.
